

ABSTRACT

The invention describes a swimming aid device for wearing on the body and for providing buoyancy, including a size-variable element which is adaptable to the body size and which has a first, releasable closure means whereby the variable body size setting can be adjusted, and has at least one buoyancy element, and wherein the device has a further second, releasable closure means which can be released without altering the set body size adjustment of the size-variable element. Particularly preferred embodiments are a swimming aid device in the form of a jacket and a swimming aid device with a support strap system.
